                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nuclectide sequences can also be used for the recombinant production of a protein, while nuclectide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonuclectides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                        sequences encoding can be interleukin-13 (IL-13) clones 80 and 78 respectively. The inversion relates to canhe and 78 respectively. The inversion relates to canhe and 78 respectively. The inversion relates to canhe EL-13, feline fellone CD154 (CD40 ligand), canhe IL-5, canhe IL-13, feline interferon alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (6MCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cagaatcaggcatccctctgcaacggcatgatgtggagcgtcaacctgaccgccggc 120

condences encoding canine interleuring (II-13) clones 80
and 78 respectively. The invention relates to canine
LL-4, canine or feline flt-3 ligand, canine IL-13, feline
IL-4, canine or feline flt-3 ligand, canine IL-13, feline
LL-4, canine colory canine IL-5, canine IL-13, feline
interferon-alpha (FN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
immunoregulatory proteins. The prophylactic regulation of an immune
colony-stimulatory proteins. The prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
They may be used to treat autoimmune or infectious diseases including
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 cagaatcaggcatccctctgcaacggcagcatggtgtggagcgtcaacctgaccgccggc 120

                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences 25552-25560 and 255561-25556 represent cDNA
sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respecitively. The invention relates to canine
IL-4, canine or feline Fit-3 ligand, canine or feline CD40, canine or
interferon-alpha (IRN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
colony-stimulating factor (GMCSF), and incleotides may be used as
vaccines for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
modulators of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,

ó
           response in animals (particularly cats, dogs, horses and humans).

They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61
                                T lymphocytes were induced by phorbol-2-myristate-3-acetate (PMA) and phytohaemaglutinin (PHA). Poly (A)+ RNA was isolated from the cells and reverse transcribed to CDNA. The CDNA was subjected to hybridisation with polyA RNA from the monkey kidney cell line COS3. DNA specific for peripheral blood mononuclear cells (PBMC) (i.e. which did not hybridise) was cloned in pSEI to construct a DNA bank. The bank was screened with CDNA prepared from PBMC which had been stimulated with PMA (and opt.PHA) and with a mixture of
                                                                                                                                                                                     oligonucleotides specific to other cytokines. One positive clone (i.e. which hybridised more strongly to cells induced with PHA and PMA, c.f. PMA alone, and did not hybridise to known cytokine probes) was designated pSEI NG30. It included a 1282 bp ORF with two potential ATG initiation codons and four potential signal sequence cleavage sites. A second positive clone differed only in the identity of codon 41 which was GGC (Gly) in stead of GAC (Asp)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2 gecetytyaetecetececaaceeteaaggageteattyaggagetggteaaeateaeee

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                     1 agccctgtgactccctcccc.....atcgccatggaaatttcaga 330

sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
11-4, canine or felline Fit-3 ligand, canine or felline CD40, canine or
felline CD154 (CD40 ligand), canine IL-5, canine or felline CD40, canine or
felline CD154 (CD40 ligand), canine IL-5, canine interferon-alpha (IFN-alpha) and felline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
colony-stimulating factor (GMCSF), and inhibitors may be used as
nucleic acids, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
andulators of activity, while the antibodies may be used in detection,

and 78 respectively. The invention relates to canine
anterferon-alpha (IFN-alpha) and feline granulocyte macrophage
anterferon-alpha (IFN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides may be used as
anceled actions. The proteins. Their sasociated
nucleic acids, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophylactic regulation of an immune
and an also be used to treat autoimmune or infectious diseases including
allerates, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
an also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,

Sequences 25552-255560 and 255561-255566 represent cDNA
sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or feline Flt-3 ligand, canine or feline CD40, canine or
feline CD154 (CD40 ligand), canine IL-13, feline
interferon-alpha (IRV-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated °
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tunnours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
mucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Sequences encoding caning interletion. Common of Sequences encoding caning interletion. Common of Sequences encoding caning interletion relates to caning and 78 respectively. The invention relates to caning to the confidence of feline Filt-13 ligand, caning or feline CD154 (CD40 ligand), caning IL-13, caning IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colory-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while concluded the confidence of a protein primary and confidence of a first confidence of a protein primary and confidence of a first confidence of a major of a protein primary and confidence of a first confidence of a major of a protein primary and confidence of the response from a co-administered antigen. The nucleotide fragments are useful as probes, as amplification primary and confidence of the relation of a major of a maj
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        as sources of inhibitory therapeutics (e.g., antisense oligonucleotides) The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

            nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oilyannucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

                                                                                                                                                                                                                                  Sequences encoding canine interleuring (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or feline Fit-3 ligand, canine IL-13, feline
IL-4, canine or feline Fit-3 ligand, canine IL-13, feline
IL-4, canine colfs (CD40 ligand), canine IL-5, canine IL-13, feline
interferon-alpha (IRN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
immunoregulatory proteins. The prophylactic regulation of an immune
can immunore for interapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
andulators of activity, while the antibodies may be used in detection,
and in the control of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
